C ConsultPrep AI

AMD DEVELOPER HACKATHON · HEALTH & WELLBEING

AI documents. Clinicians decide.

A patient intake conversation becomes a clear, reviewable consultation brief.

Product vision · Synthetic case example · Not clinically validated

THE PROBLEM

A patient’s story arrives in pieces

A visit can begin with a difficult task: remembering what happened, when it started, and what changed.

01	**Details are scattered**	Symptoms, timing, and context emerge across a conversation—not in a neat form.
02	**Clarification takes effort**	Patients may repeat themselves or struggle to describe what they mean.
03	**Clinicians need the context**	A useful handoff should separate what was said from what remains uncertain.

THE PRODUCT

A focused conversation, then a clinician-ready draft

ConsultPrep helps patients organize what they want to discuss—without making the clinical decision.

01

Listen

Collect the patient's own words through a short, adaptive intake.

02

Organize

Structure symptoms, timing, context, and unanswered questions.

03

Review

Let the patient correct the draft before a clinician assesses it.

AI documents. Clinicians decide.

One conversation. A traceable brief.

1	**Patient starts in their own words**	“I’ve had a mild scratchy sore throat and a runny nose since yesterday.”
2	**ConsultPrep asks a focused follow-up**	“Have you noticed any ear symptoms?”
3	**Patient clarifies and adds context**	“I haven’t noticed any ear symptoms. No, that’s all.”
4	**A draft appears for patient review**	Symptoms, timing, and the scoped ear detail—with no invented diagnosis.

A BETTER HANDOFF

The brief keeps what was said—and what wasn’t

A readable summary should help the clinician start with the patient’s account, not an AI conclusion.

REASON	**Sore throat**
SYMPTOMS	Sore throat · Runny nose
TIMELINE	Both began yesterday
RELEVANT CONTEXT	No ear symptoms noticed

Each item stays linked to the patient response that supports it. Unknown, unclear, and conflicting details remain visible for review.

HUMAN REVIEW

Safety is part of the workflow

The model helps organize information. The application controls what can be claimed and what happens next.

PRODUCT GUARDRAILS

- No autonomous diagnosis or treatment advice
- Original patient statements remain available
- Reported, denied, unknown, and unclear stay distinct

HUMAN CONTROL

- Potentially urgent symptoms interrupt routine intake
- Patient can review and correct the draft
- Clinician retains assessment and finalization

Synthetic patient example. Not clinically validated.

TECHNOLOGY

AMD-powered intelligence for ConsultPrep

AMD inference powers the patient intake and consultation summary.

INTAKE CONVERSATION

AMD inference interprets each patient turn, retains context, and guides focused follow-up questions.

CLINICIAN BRIEF

The workflow organizes reported details into a patient-reviewed, source-linked summary.

SYSTEM VALIDATION

Evaluate inference quality, response time, and summary fidelity across realistic synthetic cases.

Patient-reviewed documentation supports clinical care; it does not diagnose or replace a clinician.

VALUE HYPOTHESIS

Measure a clearer starting point

A structured, source-linked intake may help patients explain their concerns and give clinicians a more organized starting point.

WHAT WE WILL MEASURE

01 Correct capture of explicitly reported details

02 Repeated-question rate across synthetic cases

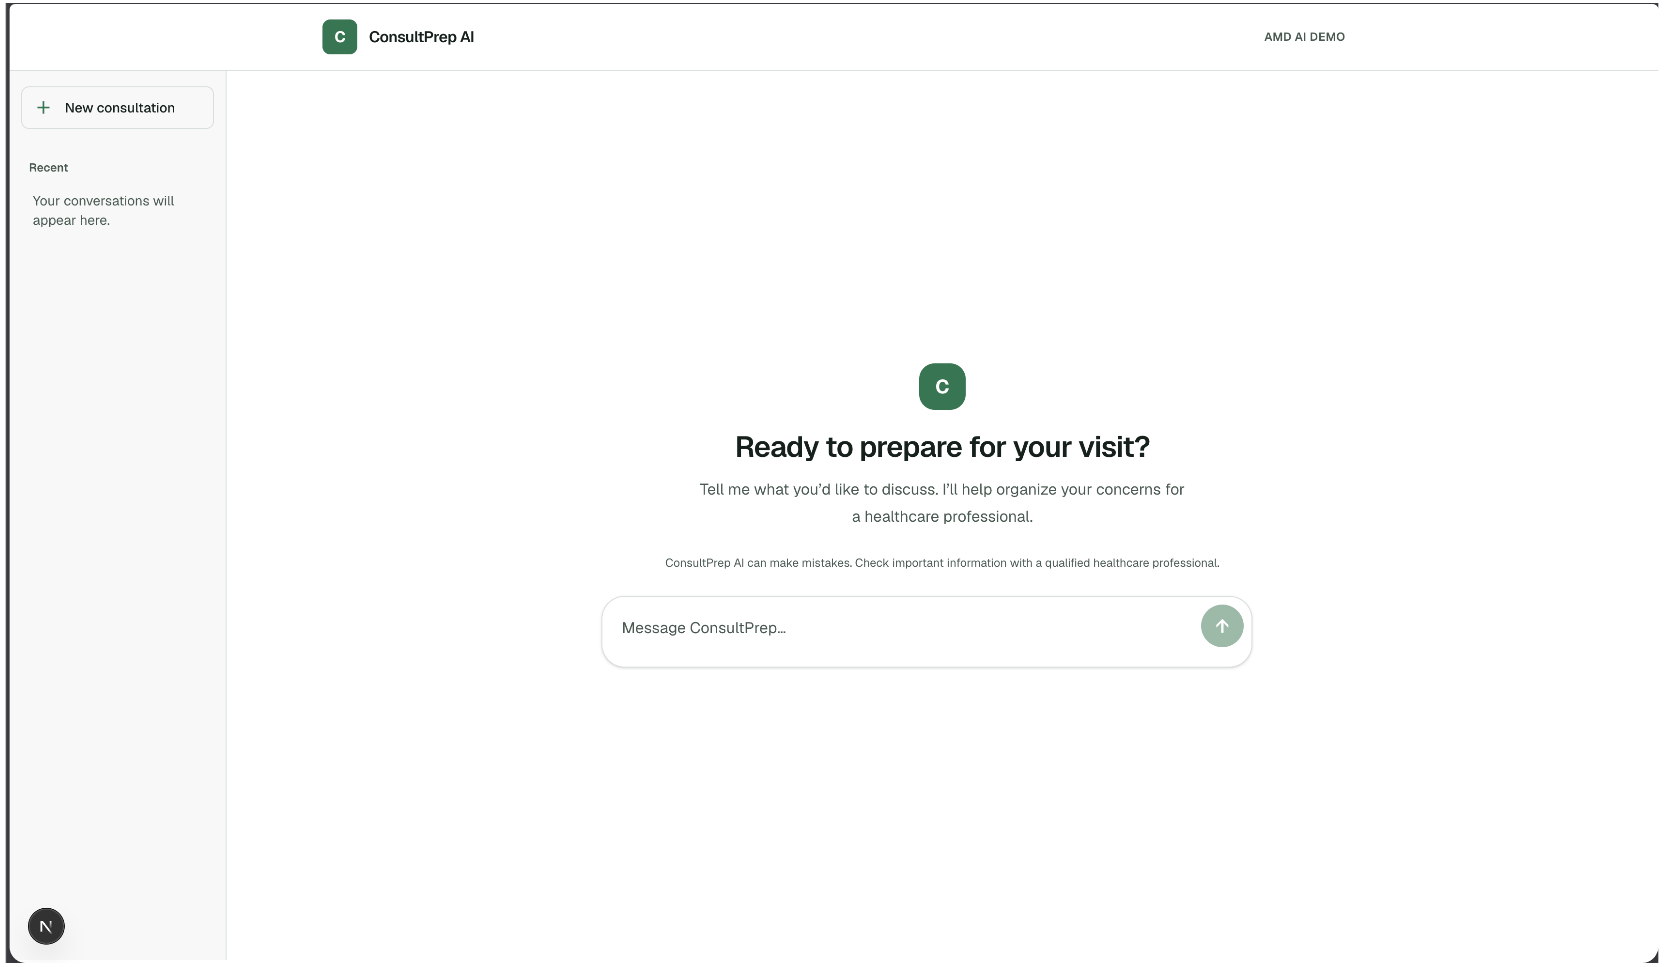

03 Intake completion and model response latency

04 Clinician rating of summary usefulness

No clinical, time-saving, or accuracy outcome is claimed before it is measured.

An active consultation

The team

Austin Pavia

AI engineering & conversational intelligence

Designed the intake engine around AMD-powered inference, with conversation context, focused follow-ups, source-linked summaries, safety handling, and response recovery.

Jose Miguel Villareal · Jian Joshua Cleofe

Application & backend engineering

Jose built API contracts, database schema and migrations, authorization, consultation persistence, and clinician review services. Jian set up backend tooling and helped stabilize intake integration and frontend tests.

John Paul Jacob

Product experience & quality assurance

Worked on the patient review experience, interaction states, usability and accessibility checks, regression testing, and release-readiness documentation.
